

Supplement Figure Legend

Supplement Figure 1. Cross analysis of cell and tissue biomarkers. (A) Clustering analysis of cell lines using prostate cancer signature mRNA isoforms. Prostate cancer cell lines could be segregated from other tumor cell lines. (B) Clustering analysis of normal prostatic tissues and prostate cancer using the specific mRNA isoforms identified in prostate cancer cell lines (see Fig. 1C). The panel failed to segregate prostate cancer tissues. Similar mis-segregations are also made using either up- or down-regulated mRNA isoforms observed in prostate cancer cells (data not shown).
